# Americans' Views on Healthcare Costs, Coverage and Policy 

Conducted by NORC at the University of Chicago with funding from The West Health Institute

Interviews: 2/15-19/2018
1,302 adults
Margin of error: +/- 3.8 percentage points at the 95\% confidence level among all adults
NOTE: All results show percentages among all respondents, unless otherwise labeled.

Q1. Thinking about both the cost and quality of the health care that Americans receive, do you think that we get good value for what our country spends on health care, or not?

## Study Methodology

This survey was conducted by NORC at the University of Chicago with funding from the West Health Institute. NORC at the University of Chicago and the West Health Institute collaborated on all aspects of the study design and reporting. Data were collected using the AmeriSpeak Omnibus ${ }^{\circledR}$, a monthly multiclient survey using NORC's probability-based panel designed to be representative of the U.S. household population. The survey was part of a larger study that included questions about other topics not included in this report. During the initial recruitment phase of the panel, randomly selected U.S. households were sampled with a known, non-zero probability of selection from the NORC National Sample Frame and then contacted by U.S. mail, email, telephone, and field interviewers (face-to-face). The panel provides sample coverage of approximately $97 \%$ of the U.S. household population. Those excluded from the sample include people with P.O. Box only addresses, some addresses not listed in the USPS Delivery Sequence File, and some newly constructed dwellings.

Interviews for this survey were conducted between February 15 and 19, 2018, with adults age 18 and over representing the 50 states and the District of Columbia. All interviews were conducted in English by professional interviewers who were carefully trained on the specific survey for this study. Panel members were randomly drawn from AmeriSpeak, and 1,302 completed the survey-1,093 via the web and 209 via telephone. The final stage completion rate is 22.4 percent, the weighted household panel response rate is 33.7 percent, and the weighted household panel retention rate is 88.1 percent, for a cumulative response rate of 6.6 percent. The overall margin of sampling error is $+/-3.8$ percentage points at the 95 percent confidence level, including the design effect. The margin of sampling error may be higher for subgroups.

In addition, African Americans were sampled at a higher rate than their proportion of the population to support additional analyses. The overall margin of sampling error for the 388 completed interviews with African Americans is $+/-7.3$ percentage points at the 95 percent confidence level including the design effect.

Once the sample has been selected and fielded, and all the study data have been collected and made final, a poststratification process is used to adjust for any survey nonresponse as well as any noncoverage or under- and oversampling resulting from the study specific sample design. Poststratification variables included age, gender, census division, race/ethnicity, and education. Weighting variables were obtained from the 2017 Current Population Survey. The weighted data, which reflect the U.S. population of adults age 18 and over, were used for all analyses.
